

unittest

单元测试

继承unittest.TestCase类

以test开头的方法就是测试方法，不以test开头的方法不被认为是测试方法，测试的时候不会被执行。

```
--self.assertEqual(a, b)
```

```
--self.assertTrue(onecmd)
```

FE:

```
self.assertTrue(isinstance(d, dict))
```

```
--self.assertRaises(oneerror)
```

FE:

```
with self.assertRaises(oneerror):
```

```
...
```

```
--unittest.main()
```

运行测试

一般在if __name__ == '__main__': 下运行

FE:

```
class Dict(dict):
```

```
def __init__(self, **kw):
```

```
super().__init__(**kw)
```

```
def __getattr__(self, key):
```

```
try:
```

```
    return self[key]
```

```
except KeyError:
```

```
    raise AttributeError(r"'Dict' object has no attribute '%s'" % key)
```

```
def __setattr__(self, key, value):
```

```
    self[key] = value
```

```
=====
```

```
import unittest
```

```
from tem import Dict
```

```
class TestDist(unittest.TestCase):
```

```
def test_init(self):
```

```
    d = Dict(a=1, b='test')
```

```
    self.assertEqual(d.a, 1.2)
```

```
    self.assertEqual(d.b, 'test')
```

```
    self.assertTrue(isinstance(d, dict))
```

```
if __name__ == '__main__':
```

```
    unittest.main()
```
