urllib.error

--urllib.request.URLError

有reason属性

FE:

```
try:
    ...
except urllib.request.URLError as e:
    print(e.reason)
```

--urllib.request.HTTPError

<u>这是URLError的子类</u>，有code和reason属性

FE:

```
try:
    ...
except urllib.request.HTTPError as e:
    print(e.code)
except urllib.request.URLError as e:
    print(e.reason)
```

<u>FE:更好</u>

```
except urllib.request.URLError as e:
    if hasattr(e,'reason'):
        ...
    elif hasattr(e,'code'):
        ...
```
